ORUS-L

Specifications are subject to change. Product is currently in release phase.

Orus L – AI-Powered, Industrial Gimbal Payload for Long-Endurance UAV & Robotics Missions

Orus L is a next-generation 3-axis gimbal payload developed by **Gremsy**, designed for **industrial-grade performance**, **multi-sensor intelligence**, and **long-endurance deployment**. With an integrated **Jetson Orin onboard computer**, Orus L brings powerful AI capabilities directly to the edge, enabling autonomous decision-making and real-time analytics in the most demanding UAV and robotic missions.

Rugged Design, Endurance-Ready

- **Aerodynamic spherical form factor** engineered for **flight stability up to 100 km/h**, ideal for **fixed-wing and VTOL UAVs**.
- **Optimize lightweight, compact** construction ensures compatibility with endurance-focused platforms.

- **IP55-rated housing** protects against dust and rain—ready for harsh field conditions.

Jetson Orin Onboard for Edge AI Processing

- Built-in **NVIDIA Jetson Orin module**, delivering **AI compute performance up to 100 TOPS**
- Enables **real-time target detection**, tracking, sensor fusion, and deep learning inference on the fly
- Offloads heavy processing from the ground station or flight controller—ideal for **autonomous operations**
- Open for third-party software involvement.

High-Precision Multi-Sensor Payload

- **EO Camera**:
  - 30x **optical zoom**, 4K resolution
  - Night vision support for low-light operations
- **IR Thermal Camera**:
  - **Radiometric 640×512** resolution with Blue UAS version powered by Flir Thermal Sensor
  - Accurate thermal inspection for infrastructure, energy, and emergency response
- **LRF – Laser Range Finder**:
  - Long-range measurement up to **2400m**
  - Enables precise ranging, target cordinate terrain profiling, and geo-referenced targeting
- **Sensor Fusion**:
  - Real-time overlay of EO/IR/LRF data
  - Enables advanced perception, situational awareness, and tracking accuracy

---

Integrated AI & Tracking Capabilities

- Developed by Gremsy, onboard algorithms include:
  - **Automatic object tracking and detection**
  - **Target lock & follow**
  - **Scene understanding & adaptive behavior**
- Works fully onboard without constant connection to GCS

Flexible Integration & Developer Support

- **Ethernet (UDP)** for real-time control
- **Ethernet RTSP** for live video streaming (EO + IR)
- **UART/MAVLink** for autopilot integration (PX4/ArduPilot)
- **Gremsy Payload SDK v3** for custom control, automation, and sensor coordination
- **Gremsy Payload Plus** for field setup and mobile operations

---

Industrial & Tactical Applications

- Powerline, wind turbine, and pipeline inspection
- Public safety & ISR mission.
- Oil & gas and refinery monitoring
- Border patrol, search and rescue, and thermal surveillance
- UGVs and mobile robotics in infrastructure diagnostics

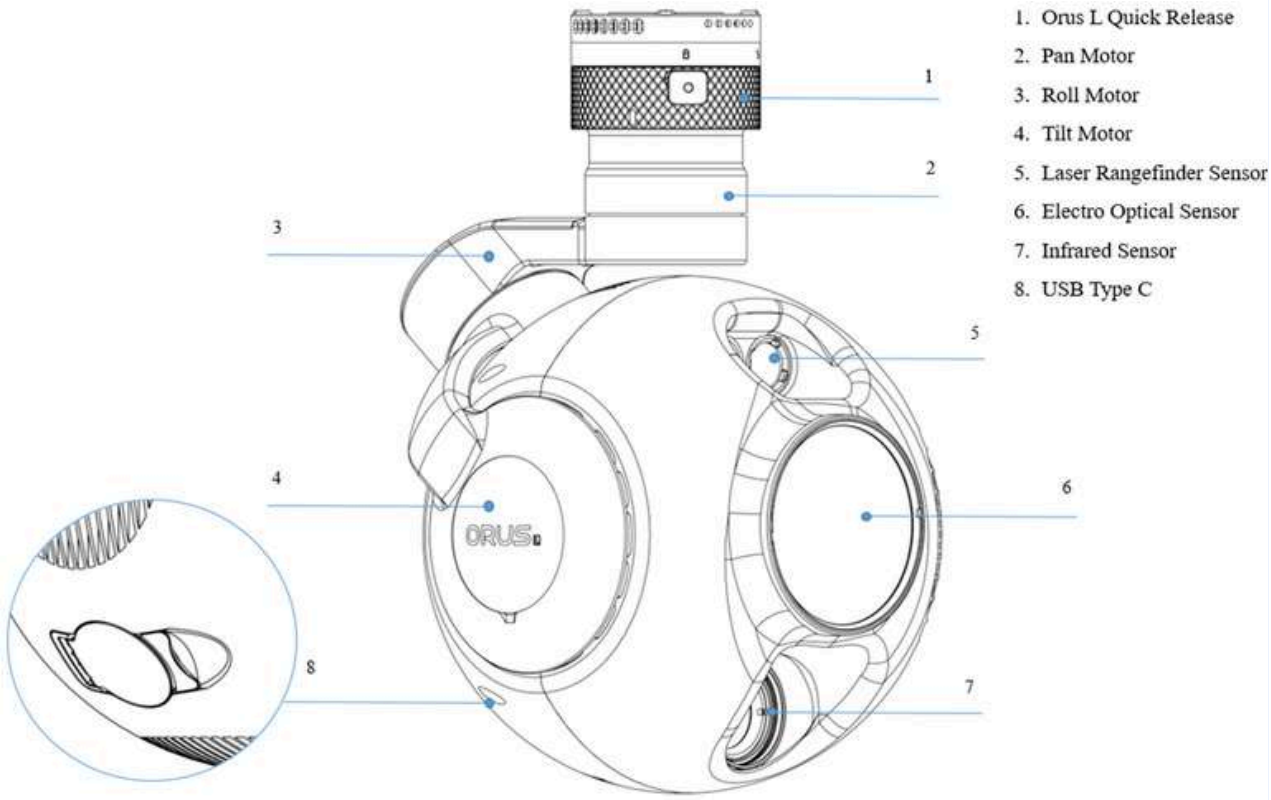
GENERAL

Specifications are subject to change. Product is currently in release phase.

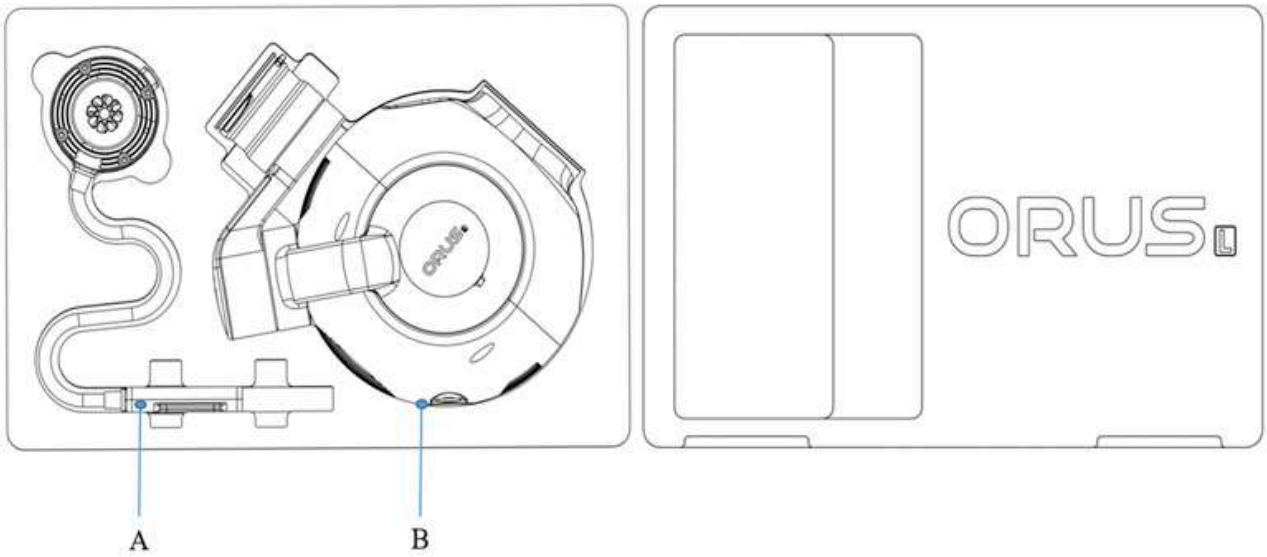
Overview

What is Orus-L?

Orus-L is a specialized payload developed by **Gremsy**, designed with a **spherical aerodynamic shape** and rated **IP55** for water and dust resistance. Built to endure harsh environments, including dust, humidity, and light rain, Orus-L remains stable even at speeds up to **100 km/h**. It's an ideal choice for **high-speed UAVs** and **demanding missions**.



What's in the box?



No.	Items	Quantity
	M-Port ip	1
	Orus-L	1
	Ethernet RJ45	1
	Ethernet Herelink	1
	MavLink Uart	1
	RC_SBUS Cable	1
	USB-C	1
	Power Supply Cable V2.0	1
	Allen Key 2.0 (mm)	1
	M3 × 8 - DIN 7991	4

ACCESSORIES

This accessory is not included in the box. If needed, please purchase it separately to ensure optimal use and a better overall experience.

SPECIFICATION

General Information

Items	ORUS-L	ORUS-L NDAA
Payload Weight (QR + Damping)	~1504g ± 15g	~1493g ± 15g

Radiometry	Yes, overlay on runtime video	Yes, overlay on runtime video

Laser Rangefinder

Feature	Specification
Max Range	• Min: 5m • Max: 1200m (10Hz) | 2400m (1Hz) • Availability: 700m (10Hz) | 1500m (1Hz)
Performance Continuous measure mode (Default)	10Hz, • 1200m* *Target size 2.3 × 2,3 m, visibility 25 km, target reflectivity 30 %, detection probability 90%
Accuracy	• 0.5m • Depending on distance and object reflectivity
Safety Classification	Class 1M (IEC 60825-1:2014)

Gimbal Specifications

Feature	Specification
Mount Type	Bottom Mount
Angular Vibration	±0.01°
Modes	Off, Lock, Follow
Controllable Range	Tilt: +40° to -120° / Pan: ±320° / Roll: ±40°
Mechanical Range	Tilt: +45° to -140° / Pan: ±326° / Roll: ±50°
Max Speed	100°/s (All Axes)

Additional Features

- **AI Object Detection**: Human, Vehicle (expandable)
- **Object Tracking**: Basic & Smart Tracking (with auto zoom)
- **Camera Sync**: EO/IR Side-by-Side Synchronization
- **Geotagging**: Based on MAVLink (autopilot or external GPS input)
- **Pinpoint Targeting**: Target coordinates overlay + SDK export
- **Video Output**: HDMI (recommend cable <50cm), RTSP
- **Ethernet File Server**: Accessible via HTTP server
- **Web Configuration Interface**: Yes

LED STATUS INDICATOR

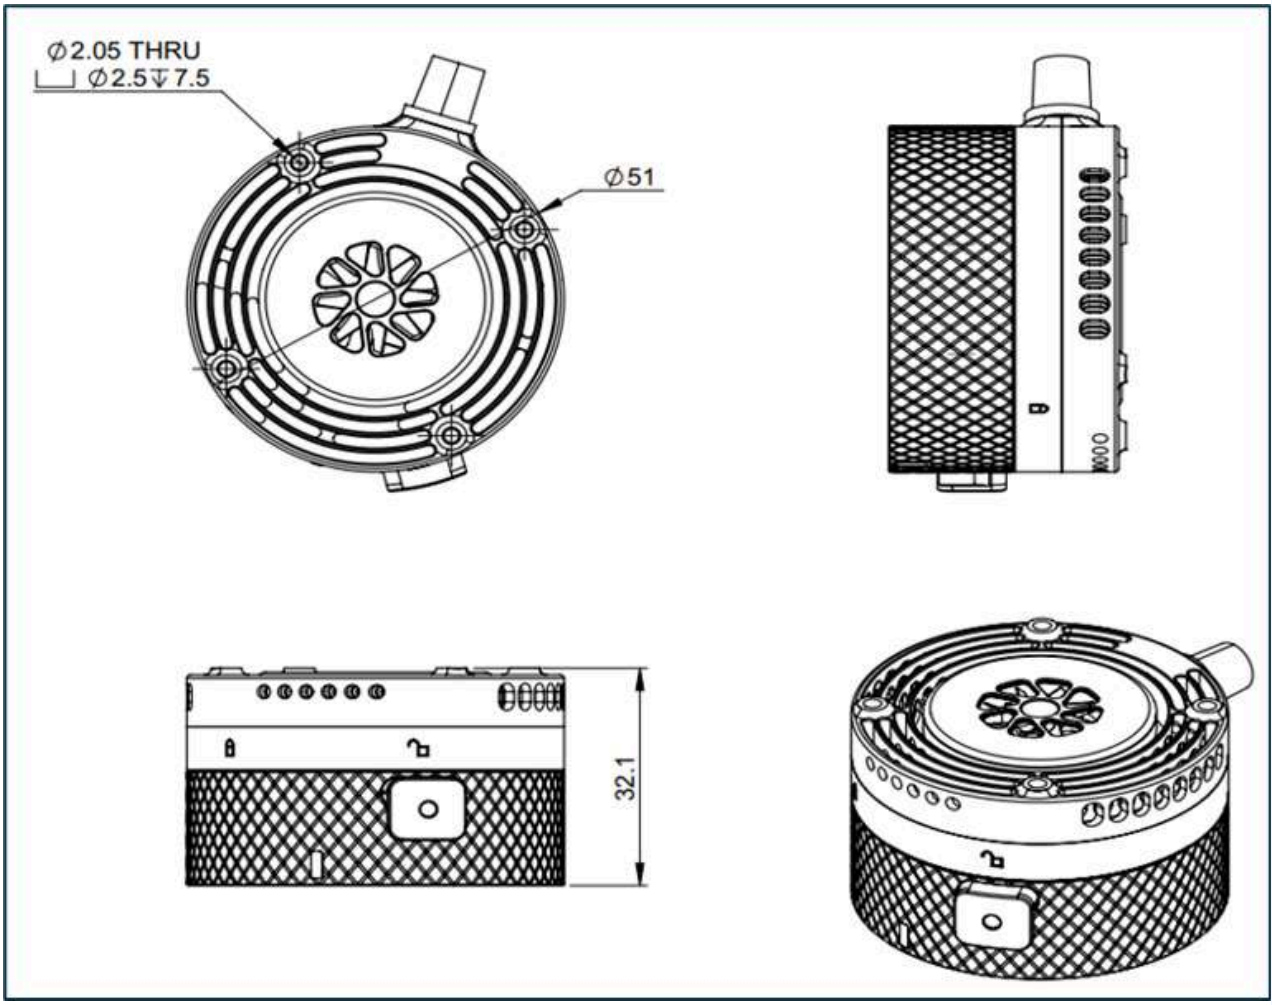
HARDWARE CONFIGURATION

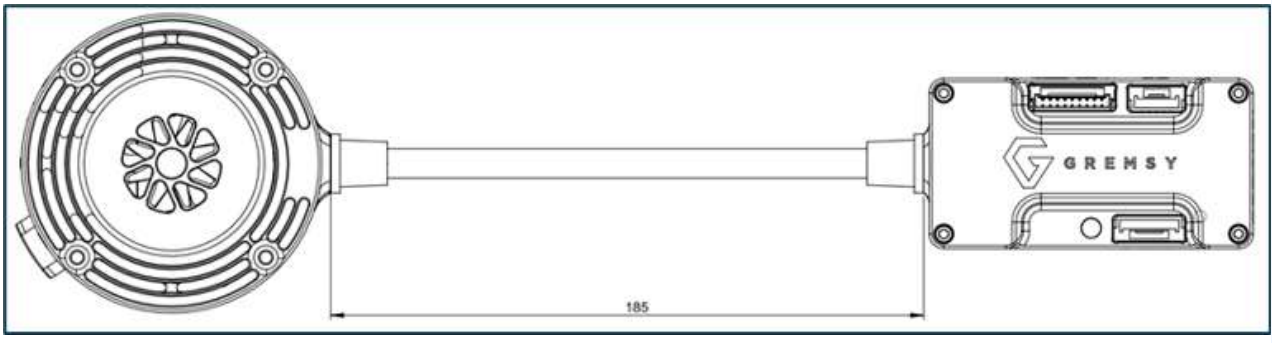
Specifications are subject to change. Product is currently in release phase.

MOUNTING

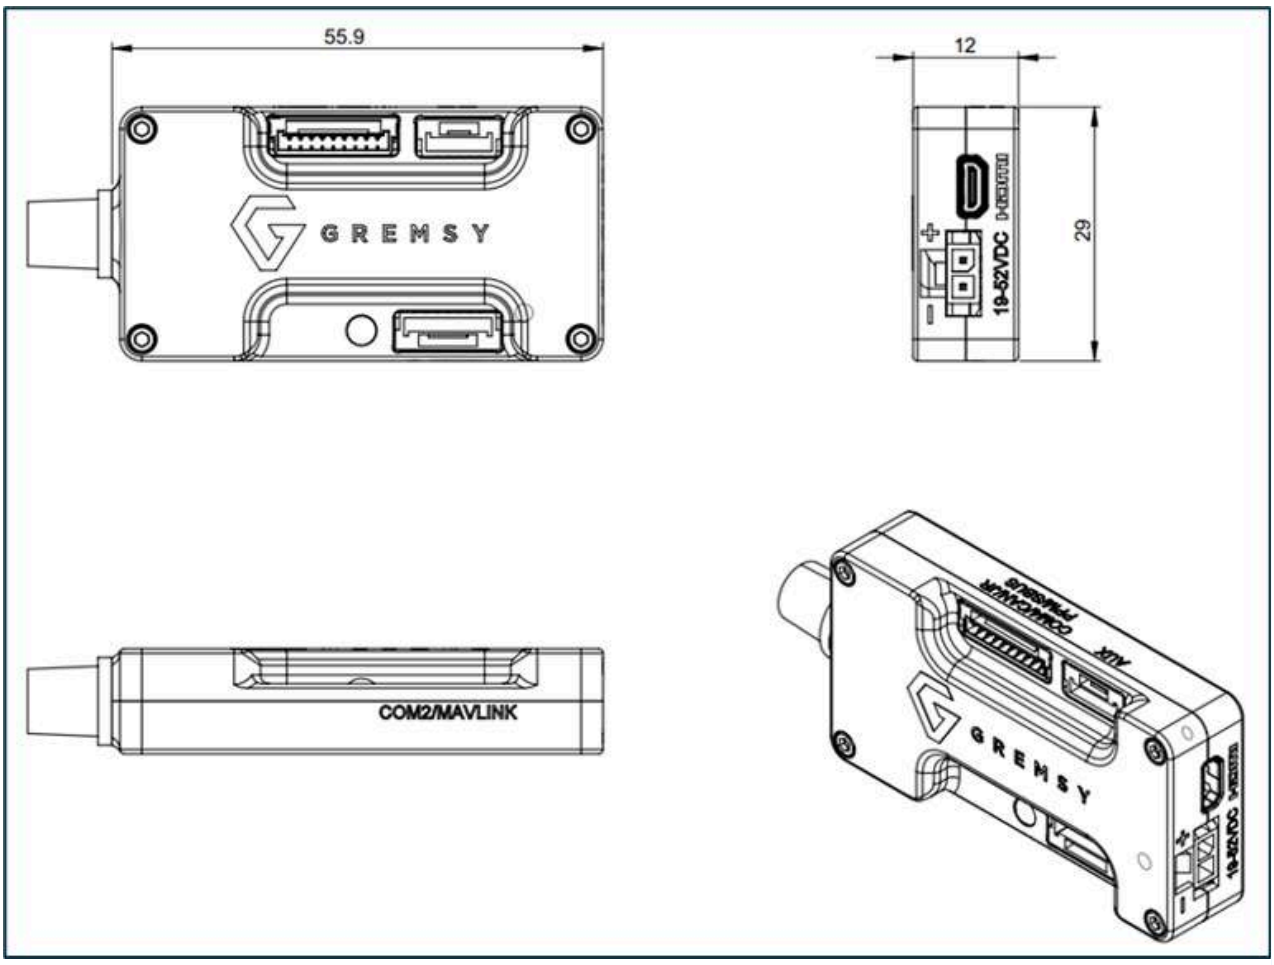
M-PORT QUICK RELEASE (IP VERSION) MOUNTING DIMENSION



M-Port IP version



CONNECTION HUB MOUNTING DIMENSION



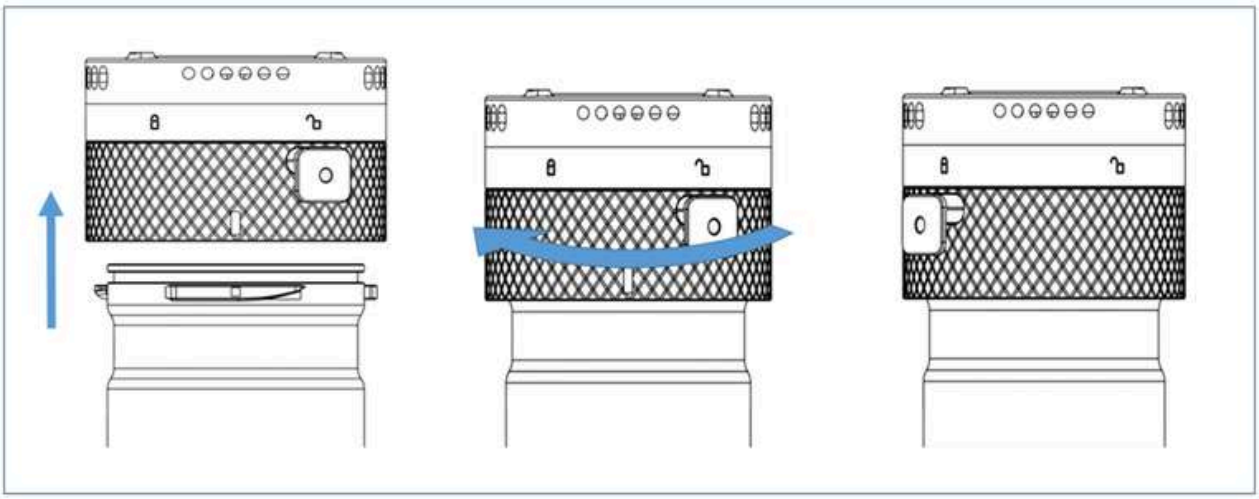
QUICK RELEASE INSTALLATION

CONNECT QUICK RELEASE

STEP 1: The marks on the top part and bottom part must be aligned. The button on the ring should be aligned with the unlocked icon as shown in the first picture.

STEP 2: Keep everything aligned and attach the bottom part to the top part.

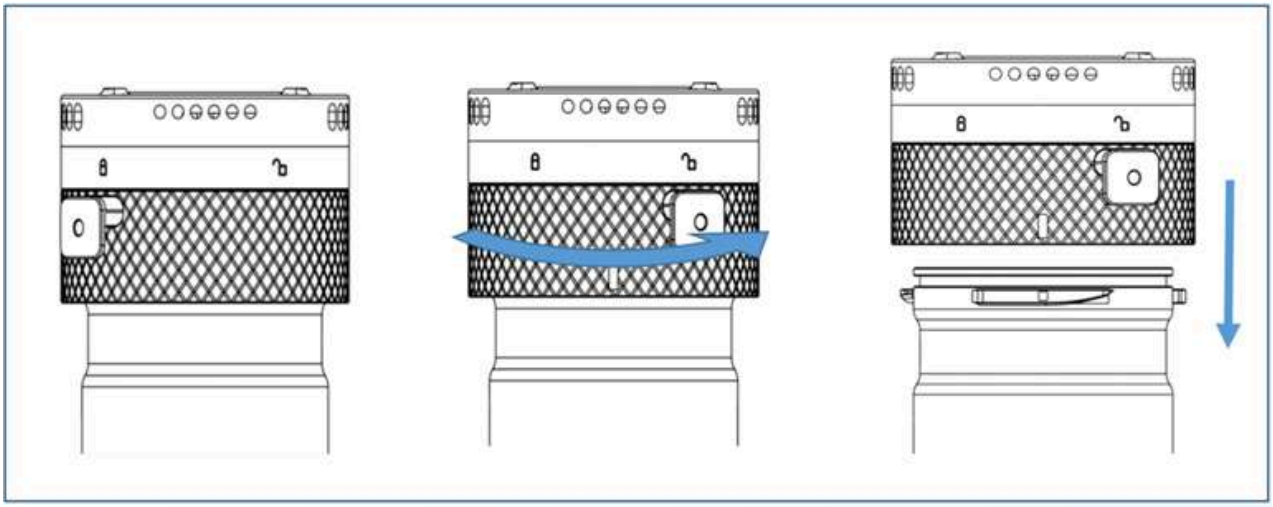
STEP 3: Rotate the ring clockwise until the button on the ring aligns with the locked icon.



DISCONNECT QUICK RELEASE

STEP 1: Press and hold the button, and rotate the ring counterclockwise.

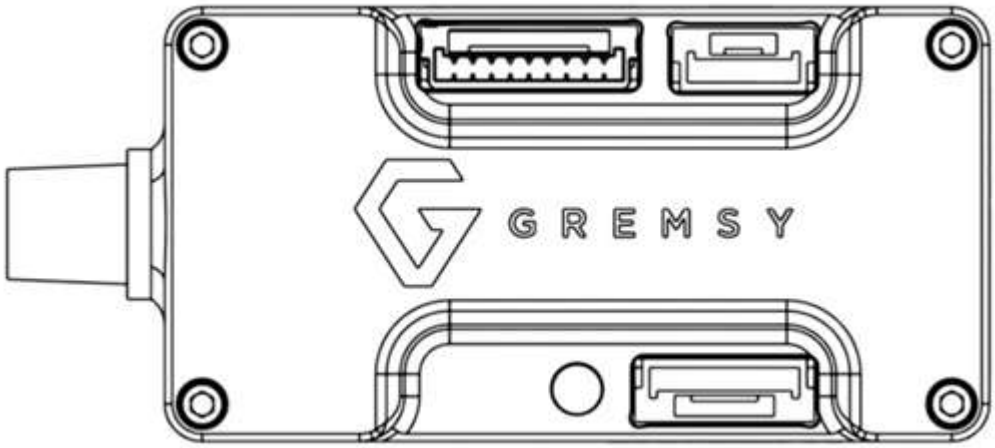
STEP 2: When the button on the ring is aligned with the unlock icon, the ORUS L can be detached from the top part of the Quick Release.



I/O CONNECTION

Specifications are subject to change. Product currently in release phase.

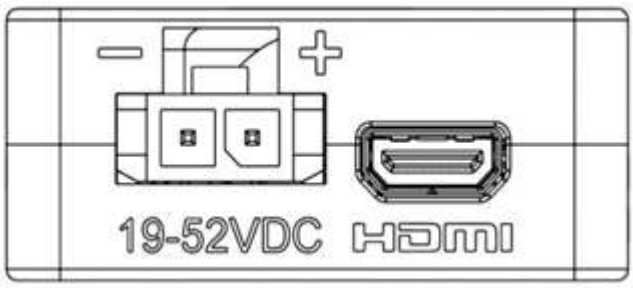
ORUS L CONNECTION HUB CONNECTORS AND PINOUTS



1. POWER

Input range: **19-52 VDC**

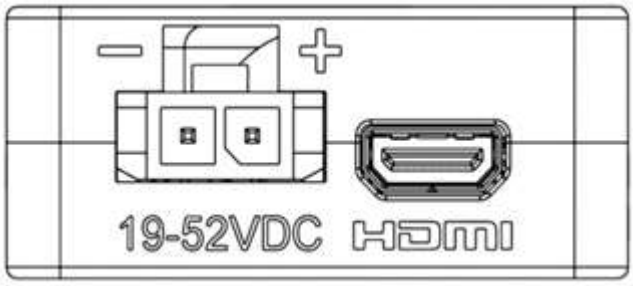
Connector type: **JST SM02B-SFKH-TF**



2. HDMI

Use to output video from the camera

Connector type: HDMI micro



3. MULTIPLEX PORT

> For wiring interfaces such as **Pixhawk COM2**, **Pixhawk COM4**, **RC_CAN**, and **RC_JR**, the corresponding cables are **not included** in the standard (Basic) package.

ETH

Connector Type: BM05B-GHS-TBT

Pinout:

- LAN_TX_P
- LAN_TX_N
- LAN_RX_P
- LAN_RX_N
- GND

COM4/CAN/JR/PPM/SBUS

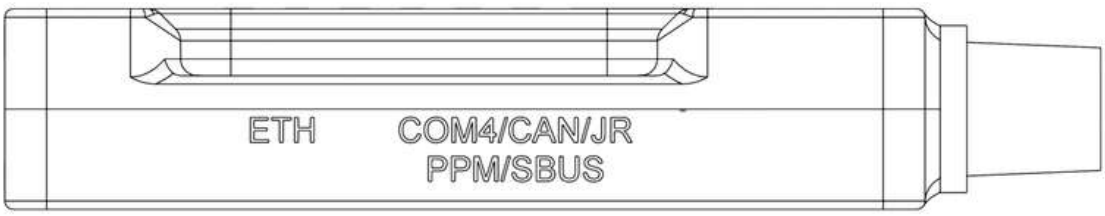
Connector Type: BM09B-GHS-TBT

Pinout:

- 5V

- SBUS/PPM
- GND
- SPEK (JR)
- 3V3
- CAN_L
- CAN_H
- GIMBAL_TX4
- GIMBAL_RX4

⚠ Supported cable not include on the package



MAVLINK

Connector Type: BM07B-GHS-TBT

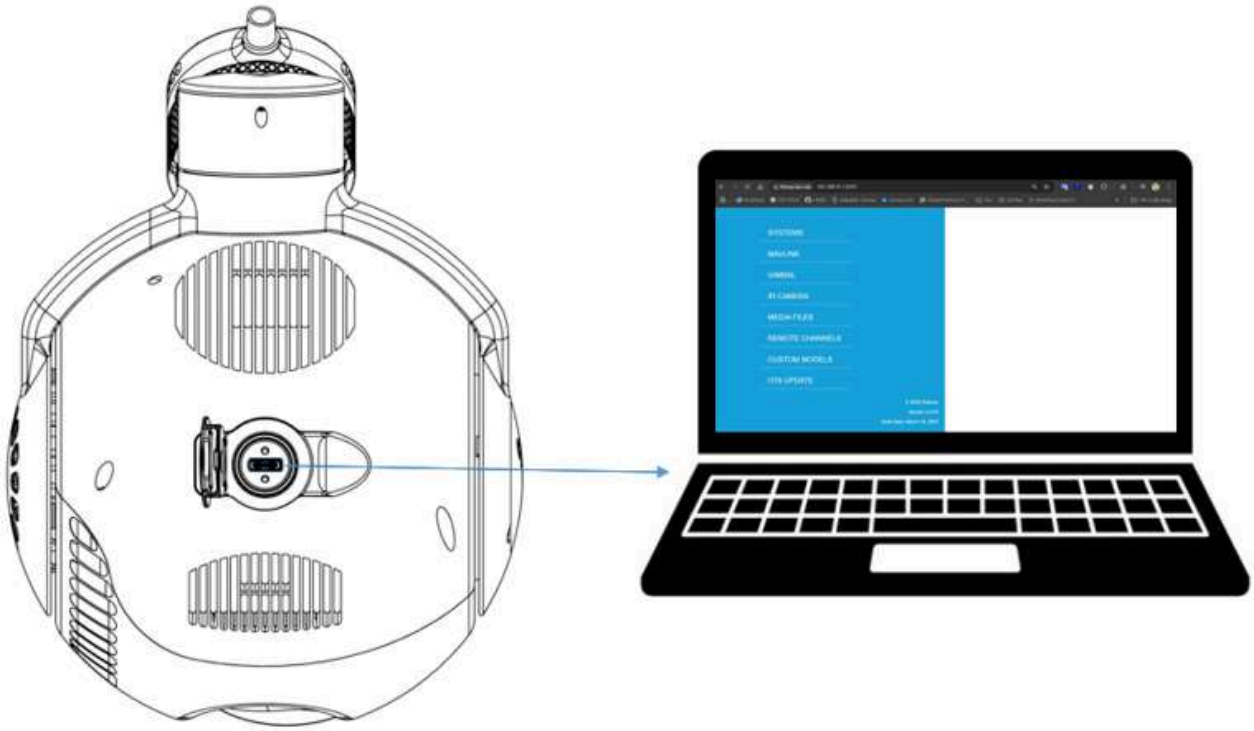
Pinout:

- RESERVE
- RESERVE
- MAVLINK_RX
- MAVLINK_TX
- GND
- RESERVE
- RESERVE

PAYLOAD CONNECTOR

1. USB-C

USB Ethernet to configure the ORUS L settings via web app and upgrade software



2. Reset Button

To reset the computer processor inside ORUS L

> Contact Support@gremsy.com before using this function

SOFTWARE CONFIGURATION

Orus L support connect with PC or similar device running Windows/Mac/Unbutu over USB-ETH connection in order to initial setup, settings param and troubleshooting

It will require for some configuration to have the stable connection over the USB-ETH connection

Why Set a Static IP?

While you connect to your computer as default IP, it may change and affect to the connection, leading to loss and instability

This article will show you how to change the IP address of computer for stable connection with ORUS-L via USB connection

1 🔌 **Step 1: Connect the Device**

Plug the device into your PC using a USB-C cable.

Your PC will automatically display a notification:
L4T-README (E:)
💡 *This confirms that the device is recognized.*

2 🌐 **Step 2: Access Network Settings**

Go to: **Settings > Network & Internet > Advanced network settings**

Locate the Ethernet adapter labeled as:
Unidentified network | Remote NDIS Compatible Device #2 (or similar)

This is the virtual network interface created for the USB-C connection.

3 🖥️ **Step 3: Edit the PC's IP Address**

You now need to assign a static IP address to this adapter.

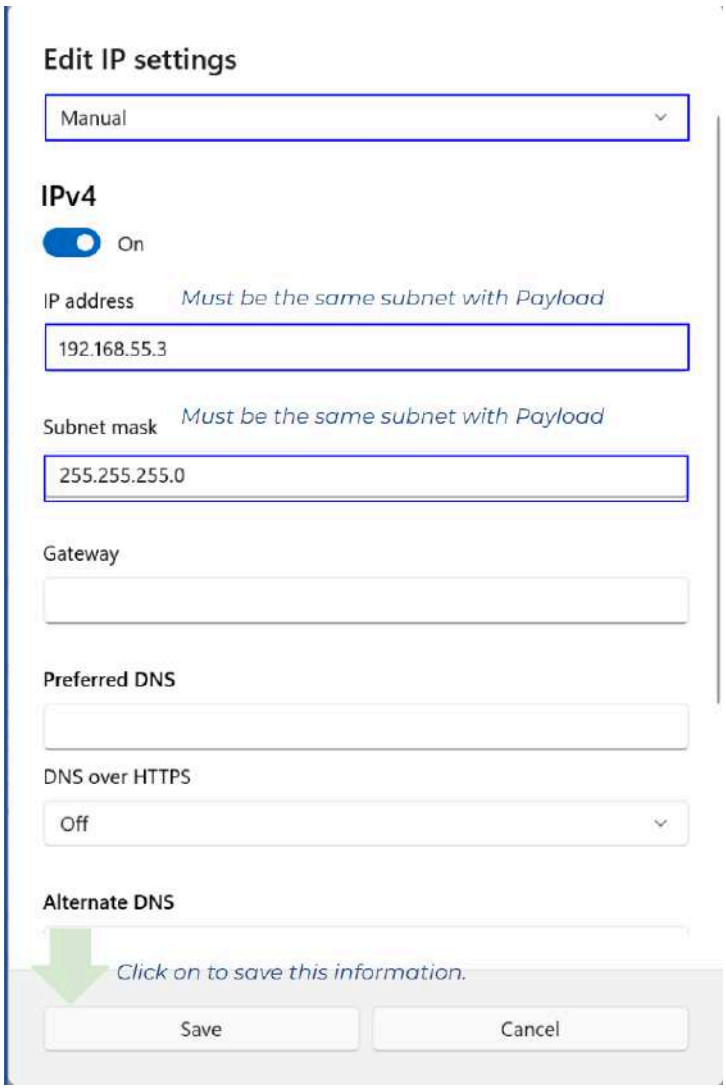
1. Click on the Ethernet adapter *(Ethernet 5 or similar).*
2. Choose **Edit IP settings.**
3. Select **Manual**, turn on **IPv4.**
4. Enter the following:
    a. **IP address:** *192.168.55.3*
    b. **Subnet mask:** *255.255.255.0*
5. Leave other fields blank unless specified by your device documentation.
6. Click **Save.**

4 ✅ **Completed**

Your PC is now on the same subnet as the connected device (typically 192.168.55.x). You can now:

- Access a web interface, link: `192.168.55.1:8000`

5 ***For Example***



Edit IP settings
Manual
IPv4
On
IP address
Must be the same subnet with Payload
192.168.55.3
Subnet mask
Must be the same subnet with Payload
255.255.255.0
Gateway
Preferred DNS
DNS over HTTPS
Off
Alternate DNS
Click on to save this information.
Save
Cancel

WEB SETTING APP

Use USB-C *(bottom of ORUS-L)* to connect the Payload Web Setting.

To check the Firmware version and Software version, also configure the parameter of Payloads

1. **How to Connect?**

- LINK: `192.168.55.1:8000`
- When connect successfully, The computer will pop up a message

> Your PC will automatically display a notification:
>
> **L4T-README (E:)**
>
> 💡 *This confirms that the device is recognized.*
>
> 
>

IP ADDRESS

Default IP Address of ORUS-L Payload

Payload Address: 192.168.12.249

Netmask: 255.255.255.0

Gateway: 192.168.12.1

Click on **“APPLY”** to save the information.

Set up an IP Address via USB Connection

1. Connect the USB Type-C port (located at the bottom of the **Orus-L**) to your computer using a USB cable.
2. The host computer will detect a new network adapter.
3. **Orus-L** will assign a DHCP IP address in the 192.168.55.x range to the host computer. Typically, the computer will receive the IP address **192.168.55.100**.
4. Verify the connection by opening a terminal or command prompt and executing:

```
ping 192.168.55.1
```

5. Open a web browser and navigate to the Orus-L settings interface:

```
http://192.168.55.1:8000
```

6. Go to the **IP Address** tab, then enter your desired static IP address.
7. Click **Apply and Reboot** to restart the **Orus-L** and apply the new static IP

settings.

Change IP Address via Ethernet Connection

If you have already changed the IP address and connected the **Orus-L** to your system using an Ethernet cable, follow the steps below to access and reconfigure the device.

1. **Connect Orus-L via Ethernet**

   Plug an Ethernet cable into the Orus-L Ethernet port and connect it to your computer or network switch.

2. **Access the Web Interface**

   In your browser, enter the updated IP address assigned to Orus-L using the following format:

   ```
   http://<orus_ip>:8000
   ```

3. **Navigate to Static IP Settings**

   Once connected to the web interface:

   - Go to the **IP Address** tab.
   - Enter a new static IP address if needed.

4. **Apply the Changes**

   Click **Apply and Reboot** to save the new configuration. The Orus-L will restart with the updated IP settings.

✅ **Tip:** Make sure your computer is in the same subnet (e.g., 192.168.55.x) to maintain connectivity.

STORAGE

This section describes how to configure the storage and recording options for the Orus-L system.

IR Image Type

Select the format in which infrared images will be saved:

- **JPEG** – Standard image format
- **JPEG & CSV** – Saves both the image and raw thermal data in CSV format

> ✅ *Use "JPEG & CSV" if thermal analysis is required in post-processing.*

Video Format

Choose the video file format for recorded footage:

- **MP4** – Widely supported and efficient for general use
- **MKV** – Supports more advanced features and metadata

Record Format

Select the video encoding standard:

- **H.265 (HEVC)** – Higher compression, smaller file sizes, ideal for longer recordings
- **H.264 (AVC)** – Greater compatibility with legacy systems

> 📌 *H.265 is recommended for modern workflows and efficient storage.*

Record Bitrate Settings

Electro-Optical (EO) Camera:

Choose the desired video quality based on your storage and performance needs:

- `20 Mbps (highest quality)`
- `14 Mbps`
- `8 Mbps`
- `4 Mbps`
- `2 Mbps`
- `1 Mbps (lowest quality)`

Infrared (IR) Camera:

Select from the following bitrate options:

- `4 Mbps`
- `2 Mbps`
- `1 Mbps`

> ⚠️ *Higher bitrates offer better image quality but use more storage.*

Saving Your Settings

Once all desired options are selected, click the **“APPLY”** button to save changes. The new configuration will take effect immediately or after a system restart, depending on the setting.

GENERAL SETTING

This section covers general configuration options to tailor Orus-L’s behavior and measurement units to your operational needs.

LRF Unit (Laser Range Finder)

Select the preferred unit of measurement for distance readings:

- `Meters`
- `Yards`
- `Feet`
- `Miles`
- `Kilometers (km)`

GPS Unit Format

Choose the format for displaying GPS coordinates:

- **Decimal Degrees (DD)** – e.g., 41.40338, 2.17403
- **Degrees, Minutes, Seconds (DMS)** – e.g., 41°24'12.2"N 2°10'26.5"E
- **Degrees Decimal Minutes (DDM)** – e.g., 41°24.2028', 2°10.4418'

Tracking Autozoom

Enable or disable automatic zoom during object tracking:

- **Enable** – Zooms automatically to keep the target centered and sized
- **Disable** – Zoom level remains fixed regardless of target movement

---

Camera Definition Location

Specify where the camera configuration is sourced from:

- **Offline** – Uses onboard definitions without requiring internet access
- **Online** – Loads updated definitions from the cloud when connected

---

Saving Your Settings

After configuring the above options, click **“APPLY”** to save the settings. Changes will be applied immediately or after a system restart, depending on the option.

VIDEO STREAMING

This section allows you to configure video streaming parameters for optimal performance based on your network conditions and operational requirements.

Auto Connect

Determines whether the stream starts automatically when the system powers on:

- **Enable** – Automatically initiates video streaming
- **Disable** – Requires manual start.

Bitrate

Sets the data rate for video transmission. Higher bitrates offer better quality but require more bandwidth:

- **512 Kbps**
- **1 Mbps**
- **2 Mbps**
- **4 Mbps**
- **8 Mbps**

Mount Point

Defines the stream endpoint name used by RTSP clients (e.g., VLC, Payload Assitant App/Desktop):

- **Default:** `payload`
- You can change this value as needed for your streaming setup.

Port

Specifies the port number used for RTSP streaming:

- **Default:** `8554`

> 📌 Ensure this port is open and not blocked by firewalls on your network.

Resolution

Select the desired output resolution:

- **1920 × 1080 (Full HD)**
- **1280 × 720 (HD)**
- **640 × 360 (Low Bandwidth Mode)**

Encoder

Choose the video compression format:

- **H.264 (AVC)** – Standard and widely supported
- **H.265 (HEVC)** – Higher efficiency, reduced bandwidth usage

---

Frame Rate

Set the number of video frames per second (FPS):

- **Range:** 1 to 30 FPS

> Lower frame rates reduce bandwidth and power consumption.

Individual IR Stream

Enable or disable a separate infrared video stream:

- **Enable** – Streams IR video independently from EO
- **Disable** – IR is not streamed or is embedded with EO feed

Saving Your Settings

Click **“APPLY”** to save and apply your selected streaming configuration.
Streaming changes may take effect immediately or require a system reboot.

PiP Configuration

Parameter	Description	Valid Range
Position X	Horizontal coordinate of the PiP window’s top-left corner	0 to 1280 pixels
Position Y	Vertical coordinate of the PiP window’s top-left corner	0 to 568 pixels
Width	Width of the PiP window	1 to 640 pixels
Height	Height of the PiP window	1 to 512 pixels

Position X:

- Enter a value between **0** and **1280**.
- This sets the horizontal position of the PiP window's top-left corner relative to the left edge of the screen.

Position Y:

- Enter a value between **0** and **568**.
- This sets the vertical position of the PiP window's top-left corner relative to the top edge of the screen.
- **Width:**
  - Enter a value between **1** and **640**.
  - This defines the width of the PiP window in pixels.
- **Height:**
  - Enter a value between **1** and **512**.
  - This defines the height of the PiP window in pixels.

LOCALIZATION

Select Timezone

- Locate the **Select Timezone** option.
- Timezone options correspond to standard global time zones (e.g., UTC±offset).

Apply and Save Configuration

- After selecting the correct timezone, click the **“APPLY”** button to confirm and save your settings.
- The system clock will automatically update to reflect the chosen timezone.

Important Considerations

- Correct timezone configuration is critical for:
  - Accurate flight logging and mission timestamping
  - Compliance with regulatory reporting requirements
  - Synchronization with ground control and data servers
- For operations spanning multiple regions or time zones, ensure the system timezone is updated accordingly prior to deployment.

GIMBAL

Gimbal Device – Firmware Update

Update the gimbal firmware using a `.hex` file provided by the manufacturer.

Steps to Update Firmware:

1. Click **“Choose File”** and select the appropriate `.hex` firmware file from your computer.
2. Click **“UPDATE”** to begin the upgrade process.

> ⚠️ **Do not power off or disconnect the device during the update.**

Gimbal Control – Autospeed

Enable or disable the automatic speed adjustment feature for gimbal movements.

- **Enable** – Gimbal movement speed adjusts dynamically based on input
- **Disable** – Gimbal speed remains constant, as defined by user input settings

---

Saving and Applying Changes

Firmware updates take effect after the update process completes.
Changes to **Gimbal Control** settings apply immediately after clicking **“UPDATE”**.

IR CAMERA

Environmental Factors

Environmental Factors – Orus-L

This section allows you to configure environmental parameters to improve the accuracy of thermal measurements based on real-world conditions.

Atmospheric Temperature (K)

- **Range:** 100 to 500 Kelvin
  Set the ambient air temperature for thermal compensation.

Distance (m)

- **Range:** 0 to 255 meters
  Enter the distance between the Orus-L and the target object to enhance thermal accuracy.

Emissivity Target (%)

- **Range:** 0% to 100%
  Defines the emissivity of the target surface.

> ⚠️ Default for most organic materials is around **95%**.

Humidity (%)

- **Range:** 0% to 100%
  Input the relative humidity of the environment, which may affect thermal

readings.

ModifyB / ModifyK

- **Range:** 0 to 255 (each)
  Advanced calibration parameters used for fine-tuning thermal correction models.

> Only modify if you have specific calibration requirements or guidance.

Window Reflect Temperature (K)

- **Range:** 100 to 500 Kelvin
  Temperature of the window or lens surface through which the sensor observes the target.

Temperature Unit

Choose your preferred unit for displaying temperature:

- **Celsius (°C)**
- **Fahrenheit (°F)**
- **Kelvin (K)**

Saving Your Settings

Click **“APPLY”** to save and activate the new environmental configuration.
Settings will be used to refine thermal imaging calculations in real time.

Isotherms Regions

Isotherms Regions – Orus-L

The Isotherms function highlights temperature ranges within the thermal image to enhance visibility of specific heat zones.

Mode

Select the desired isotherm display mode:

- **Disable** – Turns off isotherm overlays
- **Upper & Lower** – Highlights areas above and below defined temperature thresholds
- **Medium** – Highlights areas within a specified temperature range

---

Lower Temperature (℃)

- Enter the **lower threshold** for isotherm display (°C)

Upper Temperature (℃)

- Enter the **upper threshold** for isotherm display (°C)

> 💡 Use precise values to isolate thermal anomalies or regions of interest.

Measurement Range

Choose the appropriate thermal measurement range for your application:

- **-20℃ ~ 150℃** – Standard range for general thermal tasks
- **-20℃ ~ 550℃** – Extended range for high-temperature environments

---

Saving Your Settings

Click **“APPLY”** to confirm and apply your isotherm configuration.
The thermal display will immediately reflect the new settings.

IR Camera Settings

IR Camera Settings – Orus-L

This section provides configuration options to optimize the infrared (IR) camera's display, measurement accuracy, and Flat-Field Correction (FFC) behavior.

Scale

Adjust how the IR image is displayed on screen:

- **Original** – Maintains the sensor’s native aspect ratio
- **Full Screen** – Scales the image to fill the display

Overlay ROI (Region of Interest)

Enable or disable visual overlays for measurement regions:

- **Enable** – Displays measurement boxes on the IR image
- **Disable** – Hides all ROI overlays

ROI Measurement

Select the size of the temperature measurement region:

- **Small**
- **Medium**
- **Large**
- **Full Screen**

> 📌 Choose a smaller ROI for precise spot measurements or larger regions for broader thermal averaging.

FFC Mode (Flat-Field Correction)

Control how thermal noise and image uniformity are corrected:

- **Auto** – Automatic calibration based on internal logic
- **Manual** – User-triggered calibration
- **External** – Triggered by external signal
- **External with Auto Table Switch** – Uses external trigger and auto compensation table selection

---

FFC Period (Seconds)

Set how frequently FFC is triggered in **Auto** mode.

> Example: Enter `60` to run FFC every 60 seconds.

FFC Temp Delta (°C)

Set the minimum change in temperature that triggers an automatic FFC operation.

FFC Integration Period

Select the number of frames used to integrate the image during FFC:

- **2 Frames**
- **4 Frames**

- **8 Frames**
- **16 Frames**

> Higher values improve uniformity but may slightly delay frame refresh.

Saving Your Settings

Click **“APPLY”** to confirm and apply your IR camera configuration.
Settings will be used immediately or after the next FFC trigger.

MEDIA FILES

Download Image and Video – Orus-L

This section allows users to manage stored media files directly from the Orus-L interface.

IMAGE Management

Options to manage captured infrared and electro-optical images:

- **Download All** – Download all stored images to the host computer
- **Delete All** – Permanently remove all stored images from internal storage

---

VIDEO Management

Options to manage recorded video files:

- **Download All** – Download all recorded videos
- **Delete All** – Permanently delete all stored video files

> ⚠️ **Caution:** Deleting media is irreversible. Ensure backups are made before selecting "Delete All."

REMOTE CHANELS

SETTING REMOTE CONTROL MODE | GREMSY PRODUCT SUPPORT

ASSISTANCE SOFTWARE

Payload Plus App

Orus L Fully compatible with the **Gremsy Payload Plus** Android application, offering advanced control and configuration capabilities over **Ethernet (UDP + RTSP)**.

Key Highlights

- **Seamless Integration with Payload Plus**: Orus L works natively with the **Gremsy Payload Plus** app, enabling intuitive setup, real-time gimbal control, and live video preview directly from an Android device.
- **Ethernet Connectivity**: Utilizes high-speed Ethernet interface to ensure stable and low-latency communication for both control (UDP) and video streaming (RTSP).
- **Precise Gimbal Control**: Control Pan, Tilt, and Roll angles smoothly using the app interface. Adjust movement speed, mode switching, and gimbal behavior on the fly.
- **Live Video Streaming via RTSP**: Stream real-time video feed from the integrated camera to the Payload Plus app using **RTSP**, ensuring immediate visual feedback for target framing and mission planning.
- **Advanced Configuration**: Access full payload settings including object tracking, AI detection, camera indeep settings—all within the Payload Plus app.

For the detailed installation and connect with the Payload Plus, refer to the link below:

PAYLOAD PLUS

Payload Assistant Desktop

Orus L Fully compatible with the **Gremsy Assistance Desktop** offering advanced control and configuration capabilities over USB-Ethernet for settings and testing the payload.

Video Stream and Control via Payload Assistant Desktop

Use the USB-C port to stream and control the Orus-L payload using the **Payload Assistant Desktop** application.

1 ✅ **Step 1: Launch the Application**

Open Payload Assistant Desktop v2.0.0.1 or later on your computer.

> Release Payloads_Assistant_Desktop v2.0.0.1 · Gremsy/Payload-Assistant-Desktop
> GitHub

2 ✅ **Step 2: Configure RTSP Video Stream**

URL RTSP: rtsp://192.168.55.1:8554/payload

Port 8554 is used for RTSP (Real-Time Streaming Protocol).

3 ✅ **Step 3: Set Communication Settings**

- IP: 192.168.55.1
- PORT: 14566

Port 14566 is used for MAVLink telemetry communication.

4 ✅ **Step 4: Connect**

1. Status will show: "PAYLOAD CONNECTED" if successful.

2. Click "Open Video" to start the RTSP stream (video feed).
3. Click "Connect" to establish the MAVLink link via port 14566.

THIRD PARTIES INTEGRATION

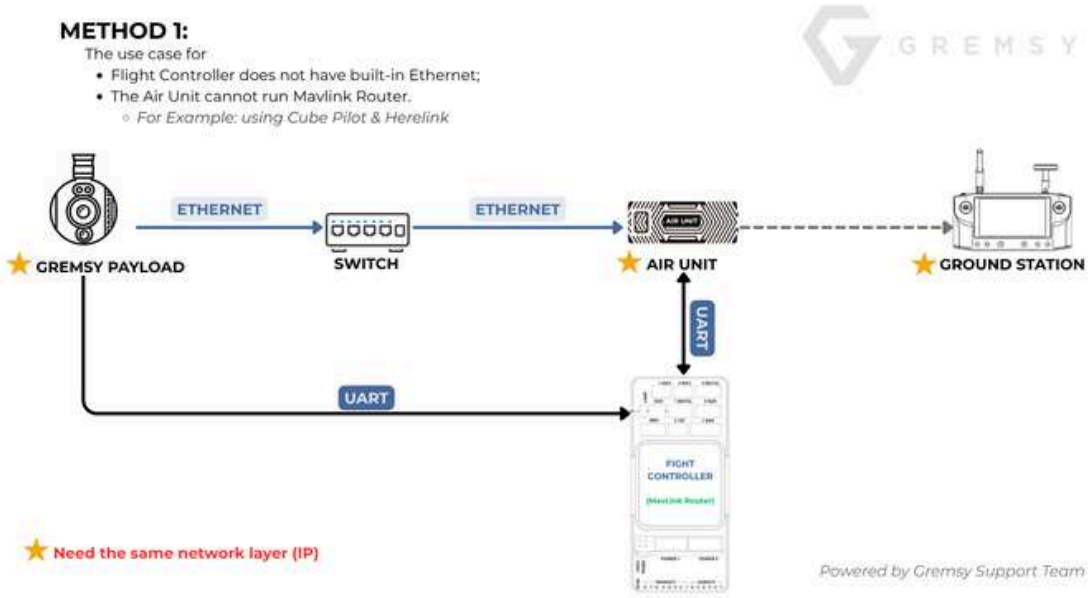
Orus L is designed to be highly flexible, allowing it to integrate into a wide range of UAVs and robotics platforms. With support for **UART**, **Ethernet (UDP & RTSP)**, **MAVLink**, and the **Gremsy Payload SDK**, users can easily adapt Orus L to fit their specific system architecture—whether it's a flight controller-based drone, an onboard computer, or a mobile robot.

Below are four common integration setups that demonstrate how Orus L can be deployed in real-world applications:

1. Mavlink Autopilot Integration (UART + Ethernet)

Ideal for traditional drones using PX4 or ArduPilot firmware.

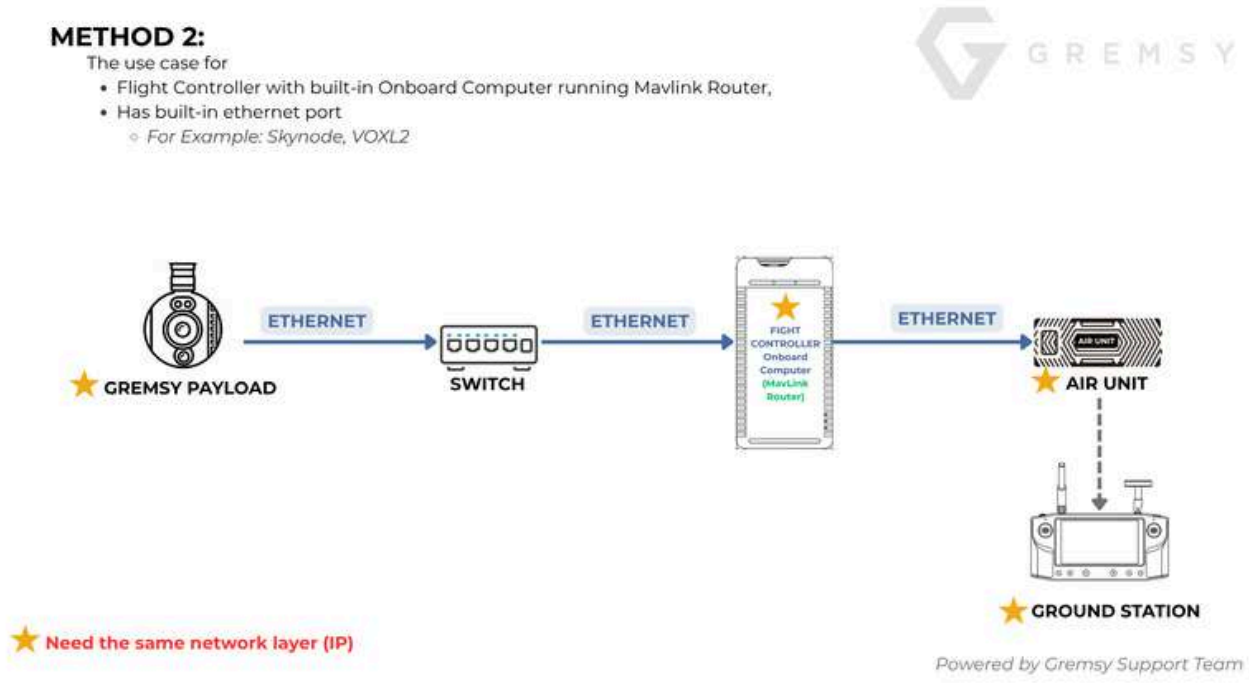
- Connect via UART
- Controlled via Mission Planner or QGroundControl
- Gimbal responds to waypoint missions and ROI commands



2. Advance Mavlink Autopilot with Companion Computer (Ethernet + SDK)

Ideally for Flight controller with onboard computing buit-in such as Skynode, VOXL2 (Jetson, RPi, NUC).

- Use Ethernet for control (UDP) and video (RTSP)
- Integrate using Gremsy Payload SDK for custom logic (optional)
- Optional MAVLink passthrough to flight controller

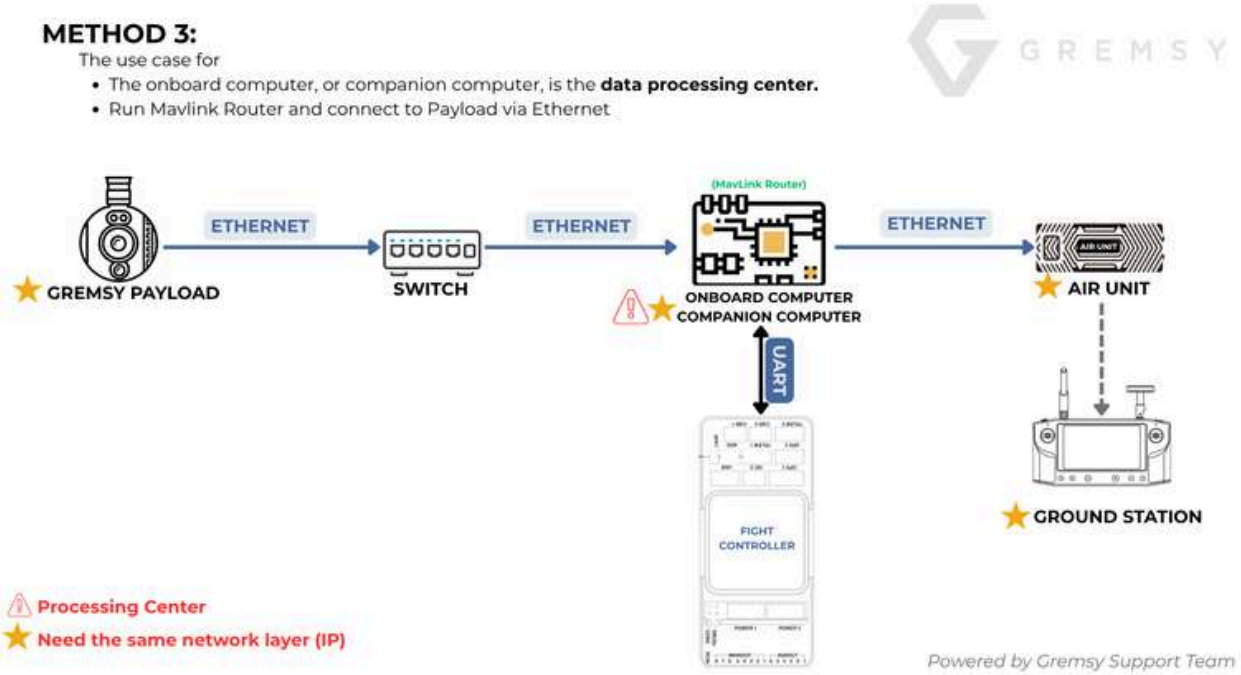


3. Companion Computer Integration (Ethernet/UART + SDK)

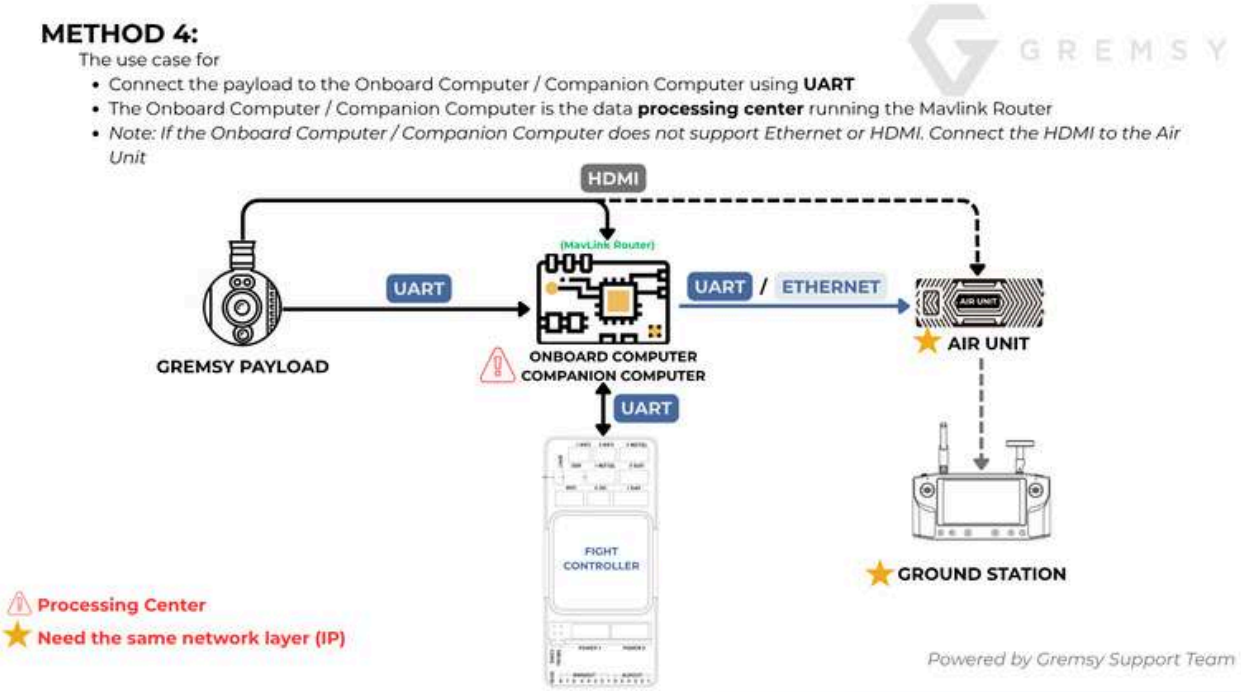
Used in ground robots or special payload systems with/without flight controller.

- Full control and video via Ethernet
- Custom logic handled by onboard PC using Gremsy SDK

3.1 Using Ethernet Connection



3.2 Using UART Connection



MAVLINK AUTOPILOT

Gremsy Payload Integration with Mavlink-based Autopilot Systems

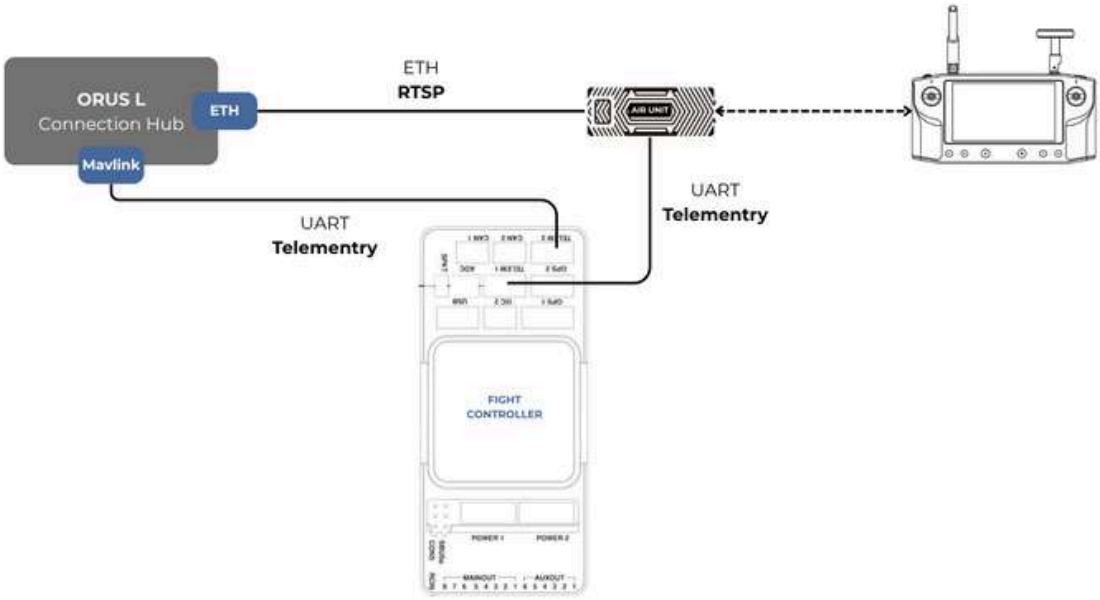
Integration Capabilities

Gremsy payloads support standard communication protocols to interface smoothly with Pixhawk systems, including:

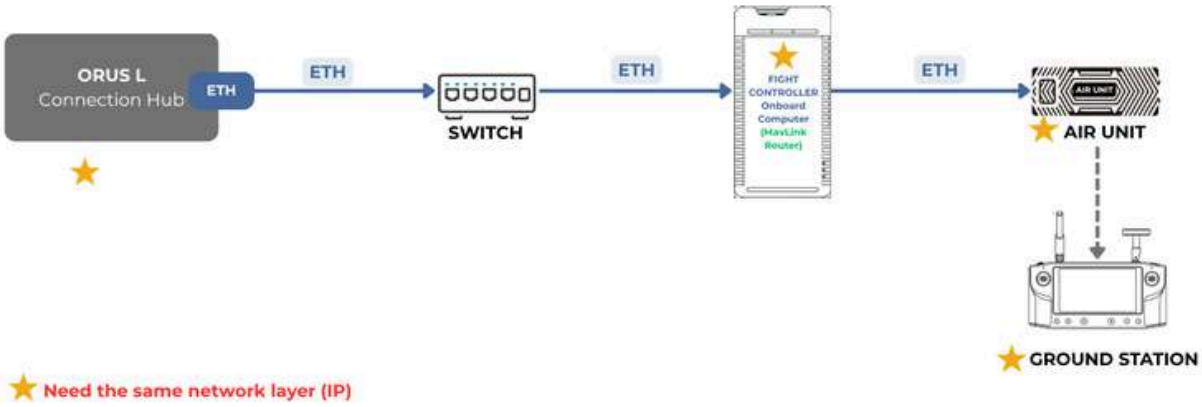
- **MAVLink v2 Protocol**: Compatible with popular firmware such as PX4 and ArduPilot. The payload can receive and respond to gimbal control commands from the autopilot, including angle control, ROI (Region of Interest) tracking, and camera navigation along waypoints.
- **UART/Serial Communication**: Gremsy gimbals offer UART ports for direct communication with the flight controller. Baud rate and protocol settings can be configured to match the specific autopilot setup.
- **Ethernet Interface**: Enables high-speed, low-latency communication for advanced use cases:
    - **UDP Protocol** for real-time gimbal and camera control commands from onboard computers or ground stations.
    - **RTSP (Real-Time Streaming Protocol)** for live video streaming from the payload camera to ground control software or network video recorders.

General Hardware Connection

1. **Flight Stack without onboard computer**
   E.g: Cube Pilot, Pixhawk series with Herelink v1.1 remote



2. **Flight Stack with onboard computer built-in**
   E.g: Skynode, VOXL2 with Herelink v1.1



SETUP WITH ARDUPILOT

Payload Telemetry & Gimbal Mount Settings

Ardupilot 4.3 or higher

Category	Parameter	Value	Description
Telemetry Setup	`SERIAL2_PROTOCOL`	`2`	Use MAVLink2 protocol
Telemetry Setup	`SERIAL2_BAUD`	`115`	Set baud rate to 115200
RC Channel Options	`RCx_OPTION`	`214`	x is desired channel match with remote/ground station button (joystick) • Standard mode: PAN control • Gremsy mode:PAN/TILT move (speed-based control)
RC Channel Options	`RCy_OPTION`	`212`	y is desired channel match with remote/ground station button (joystick) • Standard mode: Roll control • Gremsy mode: not applicable
			z is desired channel match with remote/ground

RC Channel Options	`RCz_OPTION`	`213`	station button (joystick) • Standard mode: TILT control • Gremsy mode: Select axis: PAN or TILT
Mount Settings	`MNT1_TYPE`	`6`	MAVLink Gimbal Type
Mount Settings	`MNT1_DEFLT_MODE`	`3`	Default to RC Targeting mode
Mount Settings	`MNT1_RC_RATE`	`240`	Speed control rate for gimbal
Camera Settings	`CAM_TYPE`	`6`	MAVLink Camera integration

Ardupilot lower 4.3 (limited support from Ardupilot)

Category	Parameter	Value	Description
Telemetry Setup	`SERIAL2_PROTOCOL`	`2`	Use MAVLink v2 protocol on Telemetry 2
Telemetry Setup	`SERIAL2_BAUD`	`115` (`115200`)	Set telemetry baud rate to 115200
RC Channel Options	`RC6_OPTION`	`0`	Disabled
RC Channel Options	`RC7_OPTION`	`0`	Disabled
RC Channel Options	`RC8_OPTION`	`0`	Disabled

Mount RC Mapping	`MNT_RC_IN_PAN`	`6`	PAN/TILT move (assigned to RC channel 6)
Mount RC Mapping	`MNT_RC_IN_ROLL`	`7`	Zoom control (High = Zoom In, Neutral = Stop, Low = Zoom Out)
Mount RC Mapping	`MNT_RC_IN_TILT`	`8`	Axis select (assigned to RC channel 8)
Mount Settings	`MNT_TYPE`	`4` (`SToRM32 MAVLINK`)	Set gimbal mount type to SToRM32 MAVLink

Data Stream Rate Settings (Telemetry 2)

To receive essential positioning and status information:

- `SR2_POSITION` = `10` → **GPS Position**
- `SR2_EXT_STAT` = `2` → **GPS Lock Status**

GPS Configuration via CAN

If using a UAVCAN GPS unit:

CAN Port Driver Enable

- `CAN_P1_DRIVER` = `1` → **Enable CAN1**
- `CAN_P2_DRIVER` = `1` → **Enable CAN2**

GPS Type Selection

- `GPS_TYPE` = `9` → **UAVCAN GPS**

Notification LED Settings

- `NTF_LED_TYPES` = `231` → **Enable Standard Notification LEDs**

SETUP WITH PX4

Parameter Setup

- Version: update to the latest version.
- Support Mavlink v2 protocol

Parameter	Value	Description
Firmware Version	Latest	Required for MAVLink v2 support and gimbal features
MAV_1_CONFIG	TELEM2	Assign MAVLink instance 1 to telemetry port 2 (TELEM2)
SER_TEL2_BAUD	115200 8N1	Set TELEM2 baud rate to 115200, 8 data bits, no parity, 1 stop bit
MAV_1_FORWARD	1	Enable forwarding of MAVLink messages
MNT_MODE_IN	RC	Mount input mode: manual control via RC channels
MNT_MODE_OUT	2	Mount output mode (specific to hardware/protocol)
MNT_RC_IN_MODE	1	RC input mode: angular control
MNT_MAN_PITCH	AUX3	Manual control for pitch (tilt) assigned to AUX3
MNT_MAN_ROLL	AUX2	Manual control for roll (zoom) assigned to AUX2
MNT_MAN_YAW	AUX1	Manual control for yaw (pan) assigned to AUX1
RC_MAP_AUX1	Channel 6	Maps RC channel 6 to AUX1 (yaw control)

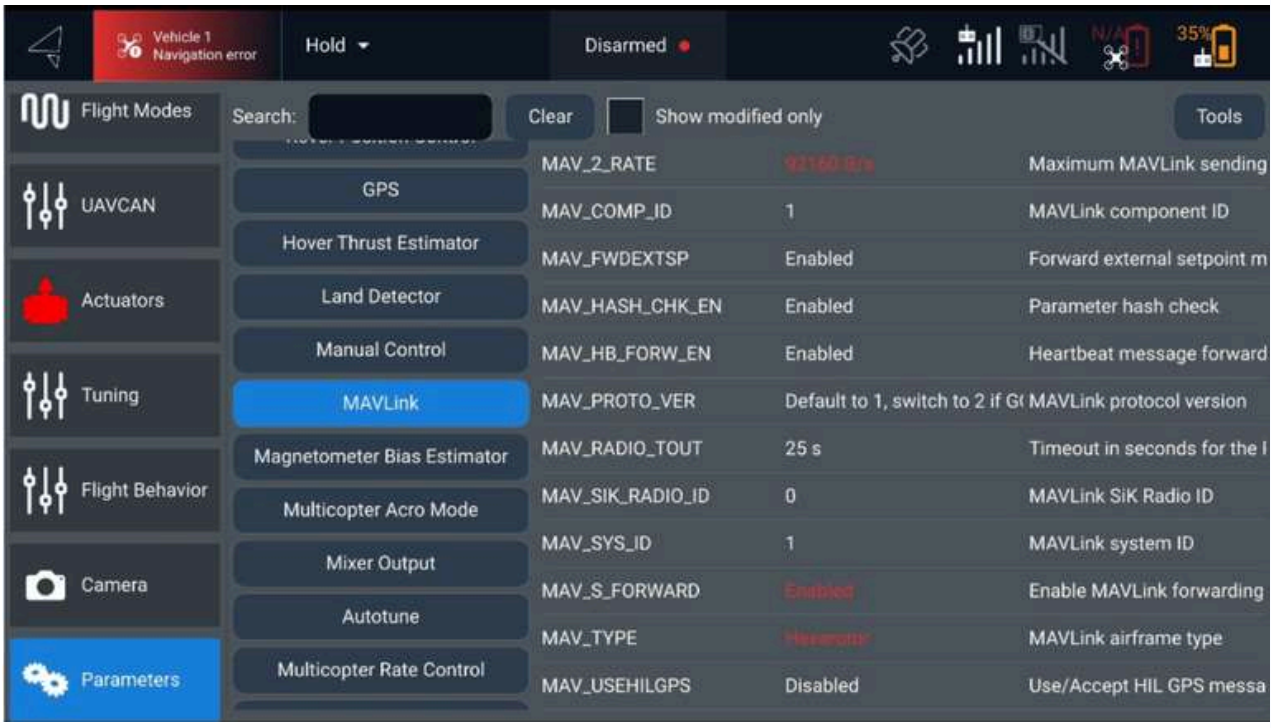
RC_MAP_AUX2	Channel 7	Maps RC channel 7 to AUX2 (zoom control)
RC_MAP_AUX3	Channel 8	Maps RC channel 8 to AUX3 (pitch control)
COM_RC_IN_MODE	3	RC input mode blending (e.g., RC + MAVLink)

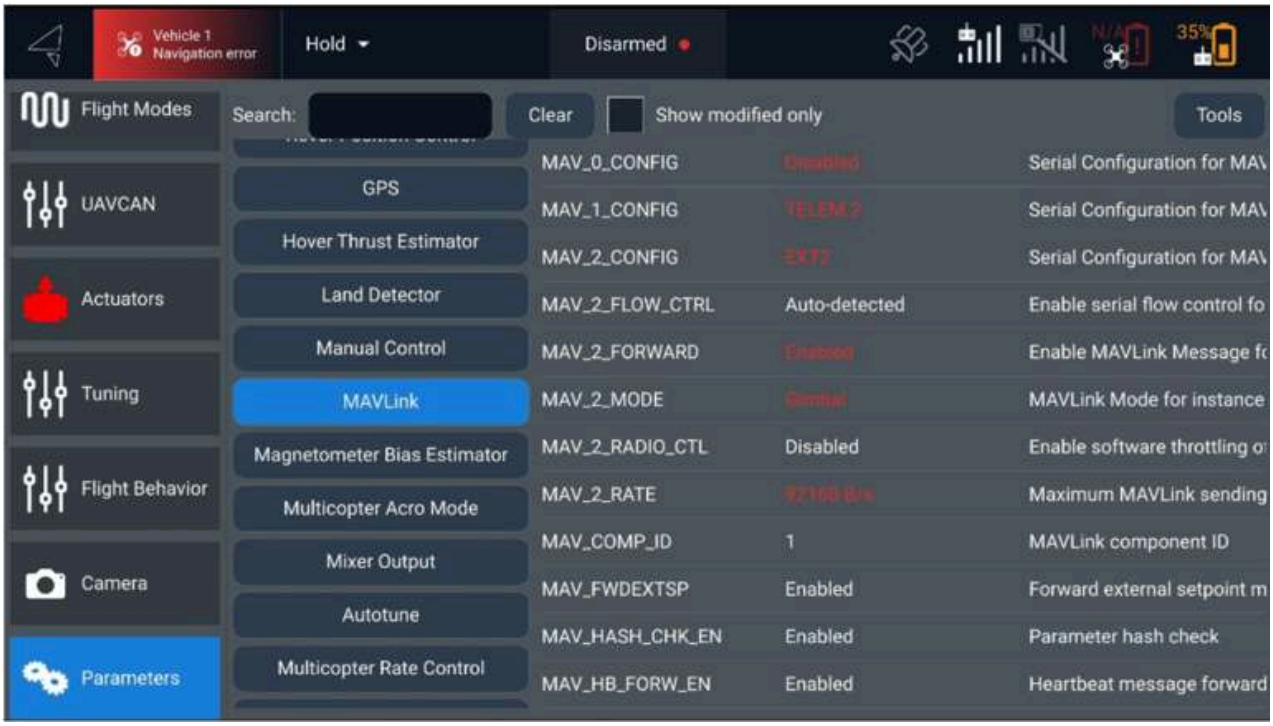
SETUP WITH SKYNODE

Parameter Settings

In the **Advanced** menu, adjust the **MAVLink** settings as needed.

No.	Parameters	Settings
1	MAV_0_CONFIG	Disabled
2	MAV_1_CONFIG	TELEM 2
3	MAV_2_CONFIG	EXT2
4	MAV_2_FORWARD	Enabled
5	MAV_2_MODE	Gimbal
6	MAV_2_RATE	92160 B/s
7	MAV_S_FORWARD	Enabled
8	MAV_TYPE	Hexarotor





Switch to the **Mount** section to continue configuring other parameters.

No.	Parameters	Settings
1	MNT_MODE_IN	Auto (RC and MAVLink gimbal Protocol V2)
2	MNT_MODE_OUT	MAVLink gimbal protocol V2
3	MNT_RANGE_PITCH	720.0 deg
4	MNT_RANGE_ROLL	720.0 deg
5	MNT_RANGE_YAW	720.0 deg
6	MNT_RATE_PITCH	720.0 deg
7	MNT_RATE_YAW	720.0 deg
8	MNT_MAN_PITCH	AUX2
9	MNT_MAN_YAW	AUX3
10	MNT_MODE_IN	Auto (RC and MAVLink gimbal Protocol V2)
11	MNT_MODE_OUT	MAVLink gimbal protocol V2

PAYLOAD SETTING

ORUS L and other gremsy payload compliance with the Mavlink protocol v2 and support for the payload settings over Mavlink telementry.

It could be integrate/embedded to the autopilot software such as Qground Control easily by manual or auto (with internet access in the first time connect).

Note: If you're running the customize software, you may need to customize the payload menu settings UI by using Payload SDK for call the API.

Payload Definition File Download

1. Manual

Download the suitable with your sofware version here:
https://github.com/Gremsy/Orus-L-Camera-Definition/releases ↗

Install to the Software Camera Settings folder

E.g: Qground control

2. Auto

Connect the Ground Station/Remote which is running the software to the internet.

Enable the Camera defination to "Auto"

Then the payload settings will be auto download and install to your device

COMPANION COMPUTER FOR UAV & ROBOTICS PLATFORM

1. System Overview Diagram

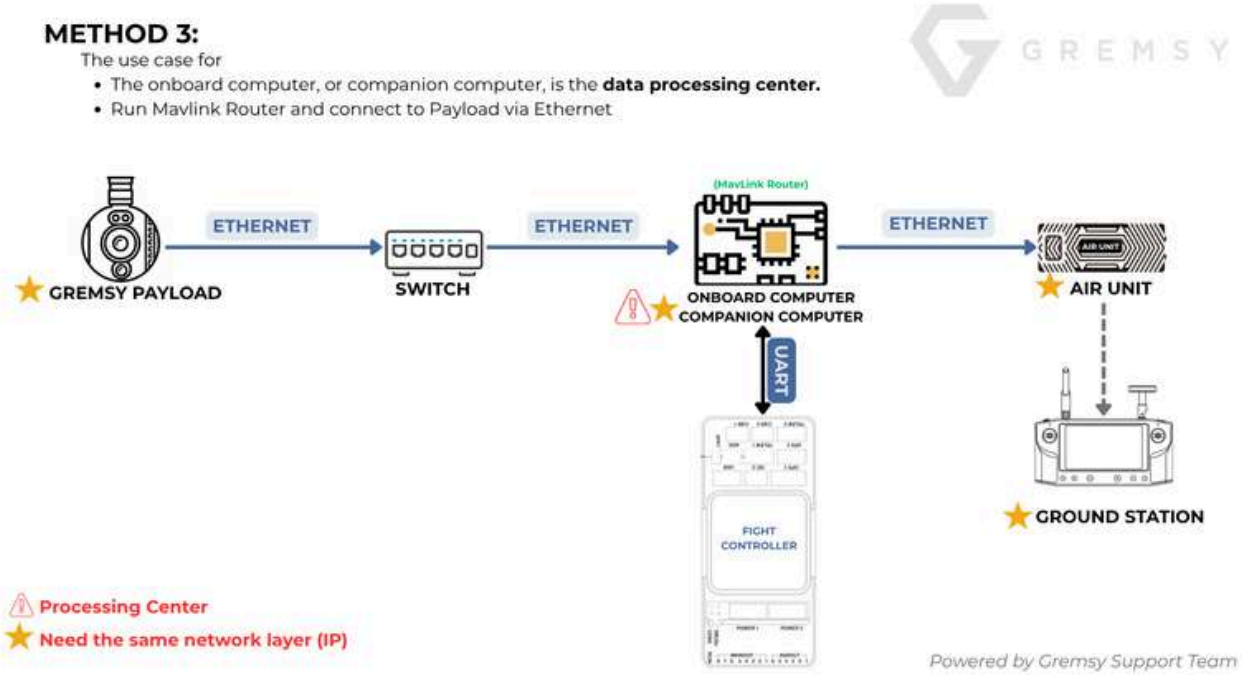
```
Companion / Onboard Computer (Jetson / RPi / NUC)
     ├── [UDP via Ethernet or UART] → Orus L Control (Payload SDK)
     ├── [RTSP Stream] ← Orus L Camera Output
     └── [Optional] → Flight Controller (MAVLink)
```

---

2. Hardware Connection

Option A: Ethernet (Recommended)

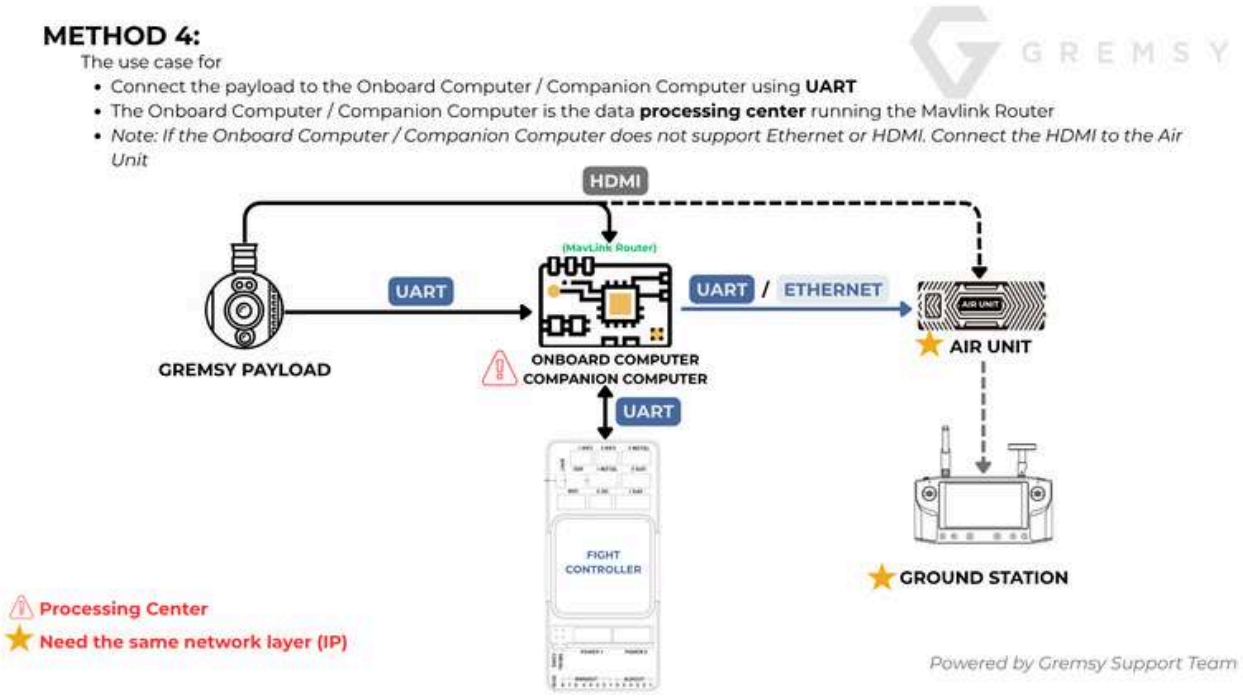
- Connect Orus L's Ethernet port to the onboard computer's Ethernet port (or via USB-C to Ethernet adapter)



Option B: UART (Alternative)

- Connect UART TX/RX lines from Orus L to onboard serial port

- Ensure proper logic level (3.3V TTL)



Optional:

- Connect Flight Controller (Pixhawk) via separate UART for MAVLink passthrough if needed

---

3. Software Setup: Gremsy Payload SDK (v3)

A. Install SDK (Python version)

```
# Clone the SDK
git clone -b payloadsdk_v3 https://github.com/Gremsy/PayloadSdk.git
cd PayloadSdk/python

# Install dependencies
pip install -r requirements.txt
```

B. Initialize SDK and Connect

```
from payloadsdk import GremsySDK

# Create SDK instance and connect via Ethernet (UDP)
sdk = GremsySDK(protocol='udp', target_ip='192.168.12.249',
target_port=14566)

# Or connect via UART
# sdk = GremsySDK(protocol='serial', serial_port='/dev/ttyUSB0',
baudrate=115200)

sdk.connect()
```

C. Send Basic Commands

```
# Move gimbal to specific angles
sdk.gimbal_control.set_angle(pitch=0.0, roll=0.0, yaw=90.0)

# Start/Stop video recording
sdk.camera_control.set_recording(True)

# Set gimbal mode
sdk.gimbal_control.set_mode('lock')
```

---

4. RTSP Video Streaming

- Use VLC or OpenCV to access the video stream:

```
rtsp://192.168.12.249:8554/payload
```

- Example with OpenCV:

```
import cv2
cap = cv2.VideoCapture('rtsp://192.168.12.249:8554/payload')

while True:
    ret, frame = cap.read()
    if ret:
        cv2.imshow("Orus L Stream", frame)
    if cv2.waitKey(1) == 27:
        break
cap.release()
cv2.destroyAllWindows()
```

---

5. Optional: Integration with MAVLink and Flight Controller

- If a flight controller is present, you can:
  - Forward MAVLink commands from Pixhawk to Orus L (mount_control)
  - Synchronize gimbal with autopilot commands
- Requires proper UART bridge and time sync if needed

---

6. Use Cases

- Onboard AI/ML target detection and autonomous gimbal pointing
- GPS-denied or tethered drone operations
- Ground robot (UGV) with 3-axis PTZ camera functionality
- Inspection and defect detection robots with onboard processing

DETAILED PAYLOAD SDK

GREMSY PAYLOAD SDK ›
